

# Going home from Ash Ward: BRONCHIOLITIS

Your child has been diagnosed with Bronchiolitis. This is a **viral infection** that causes the smallest airways in your child's lungs to become swollen. It is common in winter and normally only causes **mild cold symptoms** which **get better on their own**. Some children (especially very **young** ones) can have **difficulty breathing** or **feeds** and may need to go to hospital for observation or help with oxygen or feeding, like your child.

After supporting and monitoring your child on Ash Ward, we are now **happy they're ready to go home with you**. We know being in hospital can be scary and then being discharged even more daunting so we advise you continue to **monitor them at home** and here are some ways you can **help them**:

- If they are not feeding normally offer **smaller, more frequent** feeds. If you're **breastfeeding** you should try feeds **on demand**. If your baby is formula-fed we recommend:  
..... **oz/ml every ..... hours** (50% minimum ..... **oz/ml every ..... hours**)
- You can give them **Paracetamol** or **Ibuprofen** to help with fevers or signs of discomfort (ask your **pharmacist** for the correct medicine for your child's age group).  
**If your child is younger than 3 months and has a fever please take them to a doctor.**
- Continue giving your child any **regular medications** unless advised otherwise
- Make sure your child is **not exposed to tobacco** smoke (it sticks to clothes even if smoked outside). This can **seriously damage your child's health** and make breathing symptoms worse.

Most children get better in around **10-14 days** (though the cough can last weeks). **Days 3 to 5** can be when we see children get **more poorly**. We don't expect your child to get worse from now but you should continue to monitor them at home. Below are some **signs to check for** and what you should do if your child has them:

If your child has any of the following:

- **Blue lips**
- Is **unresponsive** or very irritable
- Is **struggling** to breathe e.g. nasal flaring, grunting, sucking in or under the ribs or at the windpipe
- Has **pauses** in breathing or an **irregular** breathing pattern

**You need urgent help**  
Call **999**  
OR  
Go to your nearest **A&E** immediately

If your child has any of the following:

- Decreased **feeding** (less than 50% of normal)
- Passing less **urine** (12 hours since last wet nappy)
- Is **vomiting**
- Has a temperature above **38°C**
- Is having some **difficulties** breathing
- If your child's health gets worse or **you are worried**

**You need to see a doctor or nurse TODAY**  
Please call your **GP surgery** or **NHS 111** for help

If **none of the above** signs are present in your child

**Self care**  
Continue to use the advice above + look after your child at **home**
